

The Koumpeli settlement is found on the North-east border of the municipality Chania. It was constructed by the building society OSSAYK SPE after many years of holdback due to Greek bureaucracy. It includes 270 plots and can have over 2000 residents. It was constructed under an organized urban plan and apart from its road and paving construction it has complete and modern networks of water supply and sewerage.

Our technical department has contributed considerably in the construction of the above name settlement. We conducted the road alignment design for the traffic system and the distribution plan of the general topographic plan and on the land of the 270 plots of the settlement. During the settlements' construction, we had the general supervision of the road alignment works.

Pictures and General Topographic Plans:
